

FeedHub A global sharing platform

FeedHub: A global sharing platform

Having an online presence is really essential these days. So here is a website that does just that in few minutes.

Features:

1. **Social media to integrate every other social media:** All your favorite pictures from Facebook, Google etc can be shared here!
2. **Guest mode:** View anyone's profile as a guest. Of course editing someone else's profile by a guest is not allowed. And there is scope for a private pictures section in the future.

On the Technical Side:

The website is built using MERN (Mongo, Express, React and Node) Stack.

The benefits of Mongo along with light-weight React makes the website really fast and responsive.

Being LAZY is a GOOD thing! When loading resources on a website.

There is a growing obsession with sharing pictures.

Problem: Lots of resources gets rendered as pages are loaded that makes website slower.

The solution: Only load resources that are visible. This is achieved using react-lazy-load library.
