

Simple Project Manager

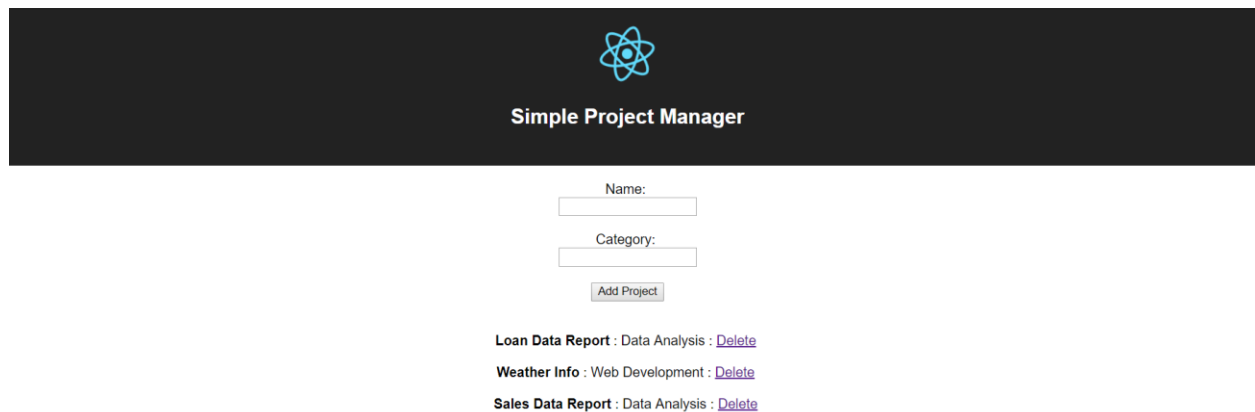

A listing service that facilitates addition and removal of projects.

The application demonstrates concepts like **component states, props and two-way data binding** that React JS provides.

The overall state is maintained in the parent component i.e. App and the child components i.e. ProjectList, Project and AddProject provides additional and removal functionalities.

Note: Child components only have the functionality interfaces; the implementations are in parent component.

In addition to above mentioned functionalities, null field validations are also performed before any insert operations.

The screenshot shows a web application titled "Simple Project Manager" with a dark header bar containing the React logo. Below the header, there is a form with two input fields: "Name:" and "Category:". Below these fields is a button labeled "Add Project". Under the button, there are three lines of text, each representing a project entry with a "Delete" link:

- Loan Data Report : Data Analysis : [Delete](#)
- Weather Info : Web Development : [Delete](#)
- Sales Data Report : Data Analysis : [Delete](#)
